

Abstract of EP0186093

1. Deformable means for sealing the gap between the edge of an opening (2) in a building and the rear end of a vehicle which has been driven up to the opening, comprising substantially vertically extending aprons (5) which are disposed on both sides of the opening in the building and are secured laterally outwardly, and the edges of the aprons facing one another are deflectable in the direction of the building by means of the vehicle, characterised by a pivotally mounted abutment member (9) which is resiliently deformable by means of the aprons during the deflection process and which is disposed in the region of the lower end of the aprons
